

Choose your project and ship them without stress.

We are here to help you in all the steps.

Before checking the Titles

Understand how we work to
develop the best premium outcome
and why you should choose
Creatorverse over others.

Why Choose Us!

*We follow
“Hell yeah or No”*

*Bridging students need by providing
“Hell yeah” project deliverables*

For Buying “Hell yeah” projects

Project with complete package(PPT, Base paper, Working video and complete codebase, Submission book, Possible questions and Presentation ideas.

- Connect with local chapter assistant
- Let Amygdala take rest
- Ace your project review

After choosing your Projects; you will be guided through the program by our executive management and will schedule a date and time on your flexibility for a group meeting with your team and explain the process completely.

Start Earning for your Side hustle

For Referring Students

- Get 1000 for each referral
- Get your project free

For Becomming a Campus Expert

- Earn 50,000 by applying for Campus Expert
- Experts and authorities to get insights and mentorship
- Premium access to Creatorverse community full of geeks with a growth mindset

Benefits

- Online networking platform for startup enthusiasts
- Expert guidance with career, Open Source, and internships, jobs
- Series of webinars
- Access to awe-inspiring books, courses, materials and what not

Exclusive access

- Premium access to Creatorverse community
- Higher Study webinars

A platform to showcase

- Pitch your revolutionary idea
- Series of Events and competitions

Choose your domain

Choose Domain and project in the last part of this brochure regarding which you'd like to do your project or pitch your idea directly to us and we'll let you know if the development is possible in the given time frame.

Domains available

- Python
- Web development
- Deep learning
- Machine learning
- Blockchain
- Artificial Intelligence
- Mobile Application development with Flutter
- Big data and Cloud Applications
- Ecommerce and agricultural related products
- Social Network related projects
- Computer vision
- Other department domain projects

After choosing your Projects type and Domain get direct IEEE verification on your project title directly with our assistance

This process is to make sure if your project is unique on the IEEE listed projects and it's not repeated by any other student projects.

We do a through check on IEEE listings to make sure your project have its own edge and comparative advantage compared to the other project submissions and tweak your title accordingly.

ABSTRACT

Pull requests form a new method for collaborating in distributed software development. To study the pull request distributed development model, we constructed a dataset of almost 900 projects and 350,000 pull requests, including some of the largest users of pull requests on GitHub. In this paper, we describe how the project selection was done, we analyze the selected features and present a machine learning tool set for the R statistics environment.

Categories and Subject Descriptors

Management

Keywords

pull-based development, pull request, distributed software development, empirical software engineering

1. INTRODUCTION

Pull requests as a distributed development model in general, and as implemented by GitHub in particular, form a new method for collaborating on distributed software development. In the pull-based development model, the project's main repository is not shared among potential contributors; instead, contributors fork (clone) the repository and make their changes independent of each other. When a set of changes is ready to be submitted to the main repository, they create a pull request, which specifies a local branch to be merged with a branch in the main repository. A member of the project's core team is then responsible to inspect the changes and pull them to the project's master branch. If changes are considered satisfactory, more changes may be requested, in that case, contributors need to update their local branches with new commits. Furthermore, as pull requests only specify branches from which certain

Permission to make digital or hard copies of all or part of this work for personal or classroom use is granted without fee provided that copies are not made or distributed for profit or commercial advantage and that copies bear this notice and the full citation on the first page. To copy otherwise, to republish, to post on servers or to redistribute to lists, requires prior specific permission and/or a fee.
Copyright 20XX ACM X-XXXXX-XX-XXXXX-XX-XXXX-XX \$15.00.

commits can be pulled, there is nothing that forbids their use in the shared repository approach (cross-branch pull requests).

To understand what the underlying principles that guide pull-based development are, we created *pullreqs*, a curated dataset of almost 900 projects along with a set of tools for its analysis. A previous version of the dataset has been used to quantitatively study the pull request development process [9]. The *pullreqs* dataset is based on our previous work on *gitremote* [7], albeit only for its construction. While *gitremote* is a full mirror of all data offered by the GitHub API, the *pullreqs* dataset includes many features extracted by combining *gitremote* and the project's repository; the dataset is offered in a format ready to be processed by statistical software. In this paper, we describe the construction process of the dataset and outline directions for further research with it.

2. FEATURE SELECTION

The feature selection was based on prior work in the areas of patch submission and acceptance [12, 3, 15, 2], code reviewing [14], bug triaging [1, 6] and also on semi-structured interviews of GitHub developers [5, 13]. The selected features are split into three categories:

Pull request characteristics. These features attempt to quantify the impact of the pull request on the affected code base. When examining external code contributions, the size of the patch is affecting both acceptance and acceptance time [15]. There are various metrics to determine the size of a patch that have been used by researchers: code churn [12], changed files [12] and number of commits. In the particular case of pull requests, developers reported that the presence of tests in a pull request increases their confidence to merge it [13]. To investigate this, we split the churn feature into two features, namely *src_churn* and *test_churn*. The number of participants has been shown to influence the time required to do a code review [14]. Finally, through our own experience analyzing pull requests, we have found that in many cases conflicts are reported explicitly in pull request comments while in other cases pull requests include links to other related pull requests. We therefore included corresponding binary features in the dataset.

Project characteristics. These features quantify how receptive to pull requests a project is. If the project's process is open to external contributions, then we expect to see an increased ratio of external contributors over team members. The project's size may be a detrimental factor to the speed of processing a pull request, as its impact may be more difficult to assess. Also, incoming changes tend to cluster over time (the "system's weather" change pattern), so it is natural to assume that pull requests affecting a part of the system that is under active development will be more likely to merge. Testing plays a role in speed of processing; according to [13], projects struggling with a constant flux of contributors use

Abstract: Biotechnology being an inter-disciplinary domain, demands an adequate theoretical knowledge of allied subjects along with good hands-on skill-sets for the graduates to be industry-ready. In this context, theme-based mini project for V semester was designed and implemented for under-graduate students of Biotechnology. The objectives of the mini project were 1) To equip the students with basic skill-sets and impart the culture of Good Laboratory Practices (GLP) & Standard Operating Procedures (SOP) and 2) To impart basic microbiological and biochemical skill-sets. The mini project was undertaken with the theme of "Isolation, Screening and Preliminary Characterization of Microorganisms Producing Selected Industrially Important Metabolites". A multi-level rubrics-based assessment was followed to measure the learning. The project addressed eight Program Outcomes (PO) whose attainment on a scale of 10 was calculated. It is concluded that the theme-based project was effective in experiential learning for the students which plays a key role in bridging the gap between industry and academia.

Keywords: Skill-sets, Good Laboratory Practices, Standard Operating Procedures, Theme base project.

1. Introduction

Biotechnology is considered as a sun-rise sector with an enormous potential in future from research and industrial perspective. Biotechnology includes a complex array of scientific and engineering disciplines, synergistically interwoven. Currently the main applications of biotechnology are in medicine, agriculture, industrial processes and environmental management. The sector is capital intensive, demands long incubation periods for product and process realization. It relies heavily on trained manpower in terms of domain knowledge and hands-on skill-sets. The methodically trained human resource in Biotechnology is crucial for any industry for its optimum performance. Hence, the academic institutions are expected to play a key role in enabling the students to make them industry-ready and bridge the gap between the two (Dahms, 2001). Various statutory bodies and professional societies like American Society for Microbiology recommend for skill-set development through academic initiatives (www.asm.org).

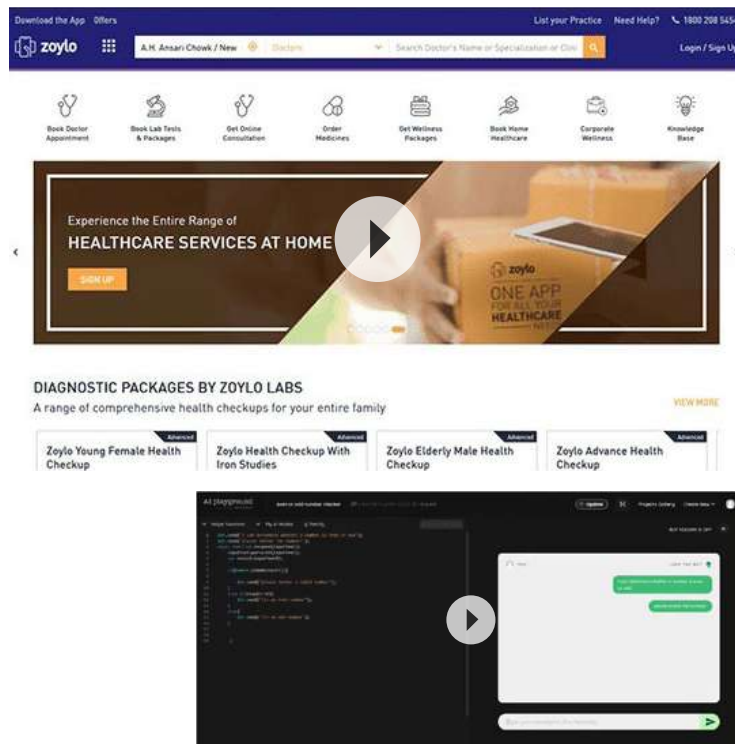

In the present scenario of Indian Biotechnology Sector, skilled workforce appears to be difficult to find due to various reasons. Hence it is essential and inevitable to transfer Biotechnology skills from academia to industry for effective implementation (Sabarwal, 2009). In this regard, the present exercise
